

# RECORDER FOR MULTISYSTEM

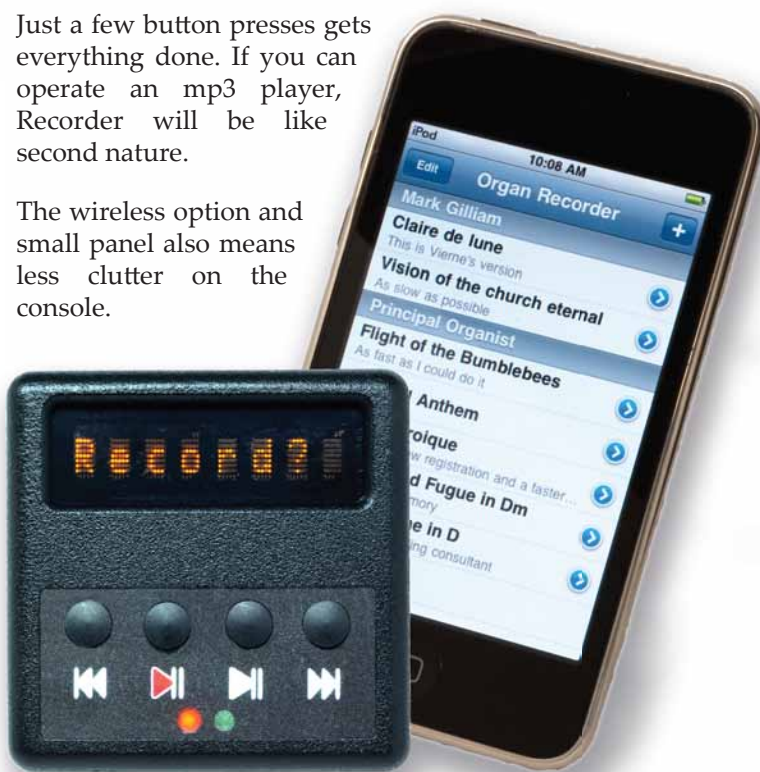

## The High Performance, Performance Recorder

The new, integrated Recorder for MultiSystem is as compact and simple to use as we could possibly make.

Fitted into a standard Solid State square control panel, using intuitive and logical controls, the Recorder operates like a portable music player. For added control choose the iPhone/iPod control with wireless control and local storage of your performances.

Just a few button presses gets everything done. If you can operate an mp3 player, Recorder will be like second nature.

The wireless option and small panel also means less clutter on the console.

Freed from the constraints of a MIDI recorder the engineers at Solid State dreamt up a high speed recording system that captures the organ performance exactly in the finest detail. Using the iPhone interface gives ultimate freedom and control.

- Built-in Recorder
- Simple, intuitive control panel
- Export/Import MIDI files with USB drive
- May be added to any MultiSystem
- Available on iPhone, iPad soon
- High resolution recording for precise playback

*Rather than blind you with science, we'll just help you build brilliant organs.*

## Recorder Details

---

### *Accurate*

The recorder captures the data stream from the MultiSystem at native speed and records it to internal memory. A USB port is provided if you want to save MIDI files to USB sticks. High sampling rates ensure precise playback of the performance including registration changes and expression.

### *Compatible*

Performance files may be exported as MIDI files to a USB stick and edited and renamed on a computer, then reloaded to the Recorder or read directly from the USB stick. Performances recorded using the iPhone are stored on the iPhone where they can be filed and renamed.

### *Imports*

Recorder will also play any MIDI files from the USB stick, although you will have to manually register the stops. You can also record files without registration to play on other instruments.

### *Available as a simple upgrade*

Recorder is available as an upgrade to the thousands of MultiSystems we have built. Adding a Recorder is simple and requires space for the black box inside the console plus fitting the control panel and USB socket to the nameboard.

In fact, the most difficult bit is cutting out for the control panel. Recorder effortlessly joins the existing MultiSystem network. If you are wondering if this will be available for your organ please ask. We are always happy to help.
